Boosting Security in Microsoft 365:

Best Practices for Admin Access

A Critical Webinar for Public Sector Admins by Enfrasys

| 3pm - 4pm (MYT) | 24 April 2025 | Microsoft Teams (Online) |

Recent breaches at LKIM, UniMAP, and MARA exposed a hard truth. Admin access remains one of the weakest links in cybersecurity.

This is not another routine webinar. It is a strategic session designed specifically for public sector professionals who manage or influence Microsoft 365 administration. The risks are real. The solutions are within reach. Now is the time to act.

What You Will Learn

- ✓ Grant Enfrasys secure GDAP access for delegated support
- ✓ Limit Global Admin roles to a maximum of three trusted users
- ✓ Configure Multi-Factor Authentication correctly and consistently
- ✓ Replace traditional passwords with passkeys for better protection
- ✓ Use Privileged Identity Management to control and audit access
- ✓ Apply Conditional Access policies to restrict admin logins to Malaysia-based IP addresses

Why This Matters

Microsoft 365 is only as secure as the people who access it. If your admin accounts are exposed, so is your entire environment.

This one-hour session will equip you with practical steps to strengthen your organization's defenses using Microsoft-native tools and governance policies.

Register Now to Take Control

Your admin panel should be your strongest shield, not your greatest vulnerability.
